### **Wool Testing Glossary**

**Average Fibre Diameter** expressed in microns

**S.D** is the standard deviation of fibre diameter. It is a measure of the fibre diameter variation within the sample. The smaller the S.D value, the more evenly sized the fibres are. Good S.D values are lower than 4.0.

**C.V** this is the co-efficient of variation of fibre diameter. As a guideline, in mature, good nutritionally fed wools the C.V values of good test results should be less than 20% whilst poor tests are greater than 23% .

**C.F** Comfort Factor as a processing guide, expressed in %, the comfort factor is associated with wools that have their fibres less than 30 microns.

**HEALTH STATUS MN3, BRUCELLOIS ACCREDITED & FOOTROT ACCREDITED**
